Calculation Policy - Functional Skills (Entry 1 to Level 2)

Purpose

This document outlines a clear, consistent calculation policy and step-by-step guides for delivering, teaching and assessing calculation skills across Functional Skills Mathematics from Entry Level 1 through Level 2.

Contents:

1. Principles and aims
2. Progression overview (Entry 1 - Level 2)
3. Allowed resources and reasonable adjustments
4. Teaching & assessment approaches
5. Step-by-step guides for each operation (addition, subtraction, multiplication, division)
 - For each level: core skills, step-by-step method, example, common errors, scaffolding
6. Quick Reference

1. Principles and aims

- Clarity and consistency: All staff use common terminology and steps so students internalise reliable methods.
- Progressive independence: Move students from concrete manipulatives (Objects such as counters) - pictorial strategies - abstract written methods and mental methods.
- Functional relevance: Prioritise methods and contexts students will meet outside the classroom (money, measures, time, simple ratios).

2. Progression overview (what students should be able to do)

Entry 1

- Add and subtract small whole numbers using objects and marks (e.g. $2 + 3 = 5$).
- Use counting on and counting back; recognise simple number words.

Entry 2

- Add/subtract numbers within practical contexts (e.g. totals to 20), use partitioning with tens and ones in simple examples.
- Begin to use multiplication as repeated addition ($2 \times 3 = 3 + 3$) and simple division as sharing.

Entry 3

- Add/subtract confidently with whole numbers up to three digits in practical contexts.
- Multiply and divide within small number ranges, simple written methods introduced.

Level 1

- Use formal written methods for addition and subtraction of whole numbers and decimals (for money), multiplication using short multiplication for one/two-digit multipliers, and short division with remainders. Apply in real-life contexts.

Level 2

- Confident use of written methods for multi-digit addition/subtraction, standard short multiplication and short division (including where quotient has more than one digit), working with decimals, percentages and compound contexts.

3. Teaching & assessment approaches

- Use concrete - pictorial - abstract (CPA) progression.
- Teach vocabulary explicitly (sum, difference, product, quotient, remainder, exchange/borrow, carry/ regroup, divisor, factor).
- Regular low-stakes practice of core skill (daily quick checks: Flashback Five).
- Diagnose gaps (e.g. missing place-value understanding) and remediate before moving to formal written methods, via Pink Pen marking and feedback.

4. Step-by-step guides for operations

Each operation below shows:

- Core skill at each level
- Step-by-step method
- Worked example
- Common errors & checks
- Scaffolding & where to move next

A. Addition

Entry 1 - Core skill

Add small counts (using objects); record answers with number or tally.

Method (step-by-step)

1. Use objects/counters. Put groups together. Count all.
2. Say the total.

Example: 3 counters + 2 counters, put the counters together, count: 1,2,3,4,5 the answer is 5.

Checks: Count again; use fingers.

Scaffolding: Use ten-frame; move to number line counting on.

3	+	4	=	7					
	1	2	3	4	5	6	7		
Use counters to find the total amount by counting.									

Entry 2 - Core skill

Add numbers within 20 using counting on and simple partitioning.

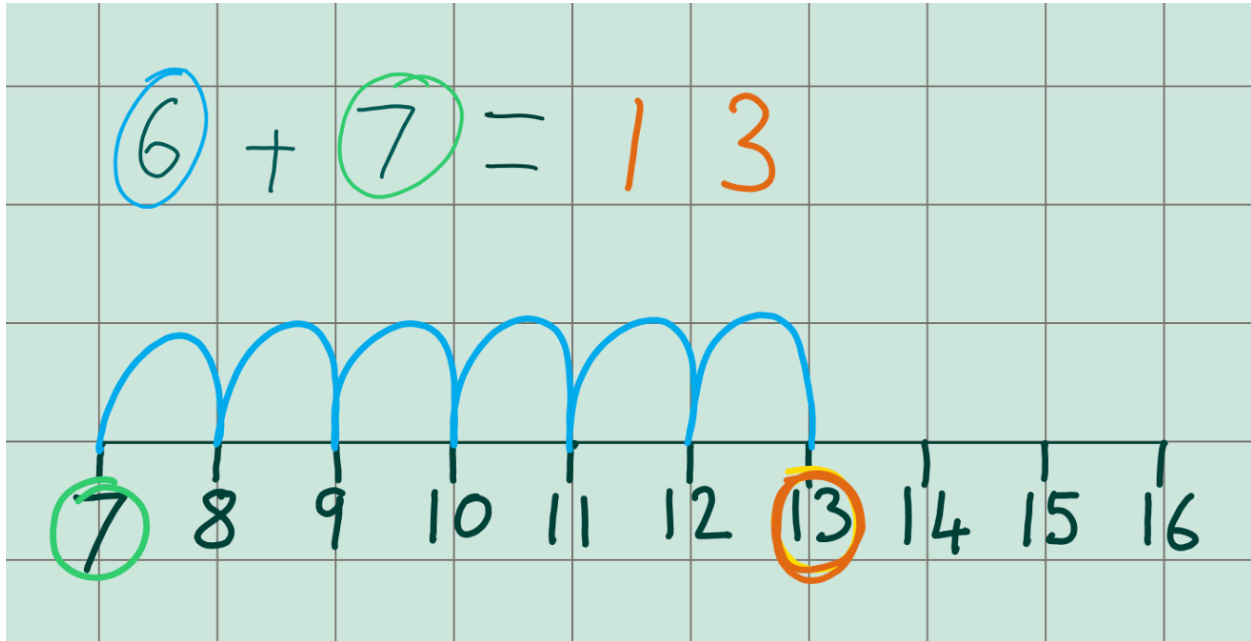

Method (counting on)

1. Start with the larger number on a number line or in head.
2. Count on the smaller number in ones.

Example: $8 + 5$, start at 8, count +5, 9,10,11,12,13 result 13.

Checks: Reverse operation ($13 - 5 = 8$).

Scaffolding: Use partitioning ($8 + 5 = 8 + 2 + 3$).

Entry 3 - Core skill

Add 2-digit numbers using partitioning (tens and ones) and informal column method.

Method (partitioning)

1. Split numbers into tens and ones (e.g. $34 = 30 + 4$).
2. Add tens together, add ones together.
3. Recombine.

Example: $34 + 28 = (30 + 4) + (20 + 8)$, **tens:** $30 + 20 = 50$, **ones:** $4 + 8 = 12$ so; $50 + 12 = 62$.

Checks: Estimate: $30 + 30 = 60$; so 62 is reasonable.

Scaffolding: Introduce column addition with carrying.

	3	4	+	2	8	=	6	2
Tens:				Ones:			Recombine:	
	3	0			4		5	0
+	2	0		+	8	+	1	2
	5	0		1	2		6	2

Level 2 - Core skill

Add multi-digit whole numbers and decimals; apply to problem solving with measures, money and percentages.

Method: As Level 1 but with multiple addends and mixed decimals; use a calculator when allowed for checking.

Example: $12.75 + 3.4 + 0.85$, align decimals ($12.75 + 3.40 + 0.85$), add right to left: $5 + 0 + 5 = 10$ write 0 carry 1; etc, result 17.00.

Checks: Estimate using rounding; check with calculator if permitted.

1	2	7	5	+	3	4	+	0	8	5
	1	2	7	5	<i>check!</i>			1	3	
		3	4	0	<i>use</i>			3		
					<i>rounding</i>					
+		0	8	5		+		1		
	1	7	0	0				1	7	

B. Subtraction

Entry 1 - Core skill

Take away small groups using objects; count what is left.
Method (concrete)

1. Start with a group.
2. Remove the amount to take away.
3. Count remaining.

Example: 5 counters – 2 counters, remove 2, remaining 3.

Checks: Use addition $3 + 2 = 5$.

5	–	2	=	3					
	①	②	③	④	⑤				
Remove			2	counters then recount.					
	①	②	③						

Entry 2 - Core skill

Counting back on a number line; simple subtraction within 20.

Method (counting back)

1. Start at the larger number.
2. Count back the smaller number in ones.

Example: $14 - 6$, start at 14, count back 6, 13, 12, 11, 10, 9, 8 the answer is 8.

Checks: Add back to check.

Entry 3 - Core skill

Subtraction using partitioning and informal column subtraction.

Method (partitioning)

1. Split the subtrahend into tens and ones.
2. Subtract tens then ones; if not enough ones, exchange from tens.

Example: $58 - 23$, partition 23 as $20 + 3$, $58 - 20 = 38$, $38 - 3 = 35$.

Checks: Addition $35 + 23 = 58$.

Scaffolding: Model exchange (borrowing) with place-value counters.

58 - 23 = 35

23 is partitioned into 20 and 3.

58 - 20 = 38

38 - 3 = 35

Level 2 - Core skill

Column subtraction with multiple-digit numbers and decimals; apply to real-life problems (change from money, time differences).

Method: As Level 1 - ensure decimal alignment; practice with mixed ones (£ and pence) by aligning decimals.

Checks: Use calculator if allowed; inverse addition.

1	6	7	3	-	0	4	5	-	7	2	1

$1673 - 0.45 = 1672.55$
 Zero fills spaces after after the decimal point.
 $954 - 0.45 = 953.55$

C. Multiplication

Entry 2 - Core skill

Understand multiplication as repeated addition and arrays (e.g. $3 \times 2 = 2 + 2 + 2$).

Method

1. Use practical arrays (rows and columns) or repeated addition.

Example: 3×4 , $4 + 4 + 4 = 12$.

Checks: Division as inverse.

	3	x	4	=	12					
	1	2	3	4						
1	1	2	3	4	make 3 rows of 4.					
2	5	6	7	8	Count all of the counters.					
3	9	10	11	12						

Entry 3 - Core skill

Use times tables (2, 5, 10) and use the grid method for small two-digit numbers.
Method (grid)

1. Partition numbers into tens and ones (e.g. $23 \times 4 \rightarrow (20 + 3) \times 4$).
2. Multiply each part, then add results.

Example: 23×4 , $20 \times 4 = 80$; $3 \times 4 = 12$; total 92.

Checks: Divide result by multiplier to check.

	2	3	\times	4	=	9	2			
	2	3		20		3		80		
2	\leftarrow 0	\downarrow	\times	4		\times 4	+	12		
		3		80		12		92		

Level 1 - Core skill

Short multiplication for one- or two-digit multipliers; multiply decimals (where appropriate) using place-value understanding.

Method (short multiplication - single digit multiplier)

1. Write multiplicand (e.g. 246) and multiplier (e.g. $\times 7$) beneath.
2. Multiply ones by 7, write ones digit and carry tens to next.
3. Continue left, adding carries.

Example: 246×7

- **ones: $6 \times 7 = 42$, write 2 carry 4.**
- **Tens: $4 \times 7 = 28 + 4 = 32$, write 2 carry 3.**
- **Hundreds: $2 \times 7 = 14 + 3 = 17$, write 17, the answer is 1722.**

Checks: Estimate with rounding; divide to check.

Scaffolding: Use the grid method before the short method.

$246 \times 7 = 1722$

$$\begin{array}{r} 246 \\ \times 7 \\ \hline 1722 \end{array}$$

Check!

$$7 \overline{) 1722} \begin{array}{l} 246 \\ \hline \end{array}$$

Level 2 - Core skill

Short multiplication with multi-digit multiplicands and multipliers (two-digit multipliers using long/grid) where appropriate; multiplication with decimals - understanding where to place the decimal point.

Method (short \times two-digit or long/grid method)

1. For two-digit multipliers, use long multiplication or grid: multiply by tens digit then by ones digit, shift and add.

$$\begin{array}{r} 24 \times 13 = \\ \quad 24 \\ \times \quad 13 \\ \hline \quad 72 \quad (24 \times 3) \\ + 240 \quad (24 \times 10) \\ \hline 312 \end{array}$$

2. For decimals, multiply ignoring decimal points then place decimal in product by counting total decimal places.

Example (1.2×0.5):

- **Ignore decimals:** $12 \times 5 = 60$. Total decimal places = 2, answer $0.60 = 0.6$.

$$\begin{array}{r} 1.2 \times 0.5 \\ \quad \underline{1} \quad \quad \underline{2} \\ \quad 12 \\ \times \quad 5 \\ \hline 0.60 = 0.6 \end{array}$$

Ignore decimal points and multiply. Count how many digits are after decimal point (2). from the last digit count in.

D. Division

Entry 2 - Core skill

Sharing into equal groups and simple grouping; understand division as sharing or repeated subtraction.

Method (sharing)

1. Share concrete objects evenly into the required number of groups.
2. Count how many in each group.

Example: 6 shared between 3, 2 each.

6	÷	2	=	3					
	●	●	●	●	●	●			
1	2	3				1	2	3	
Group 1						Group 2			

Entry 3 - Core skill

Use grouping (repeated subtraction) and understand remainder (leftover) in sharing contexts; relate to times tables.

Method (grouping)

1. Use repeated subtraction or group counters into groups matching the divisor until the remainder is less than the divisor.

Example: $14 \div 3$, subtract 3 four times ($14 - 3 - 3 - 3 - 3 = 2$), quotient 4 remainder 2.

Checks: $3 \times 4 = 12$ $12 + 2 = 14$.

	1	4	÷	3	=	4	r	2				
●	●	●	●	●	●	●						
●	●	●	●	●	●	●						
	Group 1			Group 2		Group 3			Remainder			
1	2			1	2		1	2		1	2	
3	4			3	4		3	4				

Level 1 - Core skill

Short division (bus stop method) for one-digit divisors producing whole quotients and remainders; division in contexts (e.g. dividing money or measures).

Method (short division / bus stop)

1. Place the divisor outside, dividend under the bus stop.
2. Divide the highest place value that fits; write the quotient digit above.
3. Multiply divisor \times quotient digit, subtract, bring down next digit, repeat.

Example: $154 \div 7$

- 7 into 15 goes 2 times, 2 above tens place; $2 \times 7 = 14$; subtract $15 - 14 = 1$; bring down the 1, 14; 7 into 14, 2 \rightarrow quotient 22.

Checks: Multiply quotient by divisor and add remainder.

Handwritten short division: $154 \div 7 = 22$. The quotient 22 is written in orange. The division is shown as $7 \overline{)154}$ with 0 above the 1, 2 above the 5, and 2 above the 4. A horizontal line is drawn under the 22. To the right, a multiplication check is shown: $22 \times 7 = 154$. The word "Check!" is written above the multiplication. The multiplication is shown as $22 \times 7 = 154$ with a horizontal line under the 154.

Example including a remainder:

Handwritten short division: $173 \div 6 = 28 \text{ r } 5$. The quotient 28 and remainder 5 are written in orange. The division is shown as $6 \overline{)173}$ with 0 above the 1, 2 above the 7, and 8 above the 3. A horizontal line is drawn under the 28, and a small 'r' is written to the right of the 8. To the right, a multiplication check is shown: $28 \times 6 = 168$. The word "Check!" is written above the multiplication. The multiplication is shown as $28 \times 6 = 168$ with a horizontal line under the 168. To the right of the multiplication, the addition of the remainder is shown: $168 + 5 = 173$.

Level 2 - Core skill

Short division with larger dividends and application to decimals (e.g. dividing to produce decimal quotients), interpreting remainders (rounding up, giving remainder, converting to fraction/decimal) depending on context.

Method (division producing decimal)

1. Use standard short division; when remainder remains and decimal required, add a decimal point to quotient and append zeros to dividend and continue.

Example: $25 \div 4$, 4 into 25 = 6 remainder 1, add decimal point and 0, carry the 1 remainder to make 10, 4 into 10 = 2 remainder 2, add another 0 and carry the remainder 2 to make 20, 4 into 20 = 5, the result is 6.25.

Checks: Multiply $4 \times 6.25 = 25$.

2	5	÷	4	=	6	.	2	5	
			0	6	.	2	5		
		4		2	5	.	0	2	0

5. Quick reference

Symbols & vocabulary: + (add/sum/total), - (subtract/difference/take away), × (multiply/times), ÷ (divide/share/quotient), = (equals), r (remainder).

Cheat sheet:

- When stuck, estimate by rounding.
- Check answers with inverse operation.
- Align decimal points for decimals.
- Use place-value counters for borrowing/carrying.
